Atty. Docket No.: JD-211-US

IN THE CLAIMS

Please amend Claims 1 and 10 as follows:

1. (Currently Amended) A foam nozzle for attachment to a spray nozzle comprising:
a tubular member having one end portion constructed and arranged to fit over the spray nozzle and to receive a flow of aqueous chemical solutions from an upstream to a downstream direction;
a foam producing member located in an opposing end portion; and
at least one air passageway extending into the tubular member and terminating upstream from the foam producing member[.], the air passageway constructed and arranged to extend over a portion of the spray nozzle, whereby the incidence of solutions leaking from the nozzle is reduced.
2. (Original) The foam nozzle as defined in claim 1 wherein the foam producing member is defined by radially extending rib members.
3. (Original) The foam nozzle as defined in claim 2 wherein the foam producing member includes a centrally positioned wall portion with the rib members extending radially therefrom.
4. (Original) The foam nozzle as defined in claim 1 wherein the foam producing member is positioned inwardly from the opposing end portion.
5. (Original) The foam nozzle as defined in claim 1 wherein the air passageway comprises a spacing between the tubular member and the spray nozzle, and channel members communicating with the spacing.
6. (Original) The foam nozzle as defined in claim 5 wherein the channel members are spaced equidistantly from each other.

7. (Original) The foam nozzle as defined in claim 6 wherein there are four channel members.
8. (Original) The foam nozzle as defined in claim 1 wherein the air passageway comprises at least one opening extending through the tubular member and a spacing of the tubular member from the spray nozzle.
9. (Original) The foam nozzle as defined in claim 8 wherein there are four openings spaced equidistantly around the tubular member.
10. (Currently Amended) A combined spray and foam nozzle comprising:
a spray nozzle for attachment to dispensing member;
a foam nozzle frictionally attached to the spray nozzle, the foam nozzle including:
a tubular member having one end portion constructed and arranged to fit over the spray nozzle and to receive a flow of aqueous chemical solution from an upstream to a downstream direction;
a foam producing member located in an opposing end portion; and
at least one air passageway extending into the tubular member and terminating upstream from the foam producing member[.], the air passageway constructed and arranged to extend over a portion of the spray nozzle, whereby the incidence of solutions leaking from the nozzle is reduced.
11. (Original) The foam nozzle as defined in claim 10 wherein the foam producing member is defined by radially extending rib members.
12. (Original) The foam nozzle as defined in claim 10 wherein the foam producing member includes a centrally positioned wall portion with the rib members extending radially therefrom.

13. (Original) The foam nozzle as defined in claim 10 wherein the foam producing member is positioned inwardly from the opposing end portion.

14. (Original) The foam nozzle as defined in claim 1 wherein the air passageway comprises a spacing between the tubular member and the spray nozzle, and channel members communicating with the spacing.

15. (Original) The foam nozzle as defined in claim 7 wherein the channel members are spaced equidistantly from each other.

16. (Original) The foam nozzle as defined in claim 15 wherein there are four channel members.

17. (Original) The foam nozzle as defined in claim 10 wherein the air passageway comprises at least one opening extending through the tubular member and a spacing of the tubular member from the spray nozzle.

18. (Original) The foam nozzle as defined in claim 17 wherein there are four openings spaced equidistantly around the tubular member.
